PLEASE RETAIN THESE INSTRUCTIONS WITH THE PRODUCT.
IMPORTANT SAFETY INFORMATION

1. Do not install this product in areas where the following may be present or occur:
   • Excessive oil or a grease laden atmosphere.
   • Corrosive or flammable gases, liquids or vapours.
   • Subject to direct water spray from hoses.
   • Ambient temperatures higher than 40°C and lower than -20°C.
   • Possible obstructions that may hinder access to or removal of the unit.

2. All wiring must be in accordance with the current IEE wiring regulations BS7671, or appropriate standards of your country. Installation should be inspected and tested by a suitably qualified person after completion.

3. Ensure the mains supply (voltage, frequency and phase) complies with the rating label.

4. The unit should be provided with a local double pole fused spur fitted with a 3A fuse having a contact separation of at least 3mm.

5. These units must be earthed.

6. Precautions must be taken to avoid the back-flow of gases into the building from the open flue of gas or other fuel-burning appliances.

7. This appliance is not intended for use by persons (including children) with reduced physical, sensory or mental capabilities, or lack of experience and knowledge, unless they have been given supervision or instruction concerning use of the appliance by a person responsible for their safety.

8. Young children should be supervised to ensure that they do not play with the appliance.

INSTALLATION GUIDANCE

1. The installer is responsible for the installation and electrical connection of the sentinel system on site. It is the responsibility of the installer to ensure that the equipment is safely and securely installed and left only when mechanically and electrically safe.

2. All regulations and requirements must be strictly followed to prevent hazards to life and property, both during and after installation, and during any subsequent servicing and maintenance.

3. The unit’s condensate drain must be connected to the building’s wastewater drainage system.

4. Certain applications may require the installation of sound attenuation to achieve the sound levels required.

5. The unit must not be connected directly to a tumble drier.

6. The supply and exhaust valves must be fully opened prior to commissioning.

7. The supply air must be drawn from the exterior of the property.

8. The unit should be allowed to stabilise during commissioning for a minimum period of 5 minutes when changing between boost and normal speeds.

9. Ensure that the unit’s external grilles are a minimum of 1500mm apart. The exhaust grille should be located at least 600mm away from any flue outlet. The inlet grille should be located 2000mm away from any flue outlet.

10. This product and associated duct installation should be carried out in accordance with the domestic ventilation compliance guide.

Disposal

This product should not be disposed of with household waste. Please recycle where facilities exist. Check with your local authority for recycling advice.
UK Building Regulations (ADF) Declaration of Conformance

The Sentinel Kinetic conforms to the 2010 Building Regulations (Approved Document F - Means of Ventilation) for installed performance of a ducted mechanical extract fan when installed in accordance with the instructions in this document.

Note: Read in conjunction with Operating and Monitoring manual 407160.
Product Description

Sentinel Kinetic 200ZP, 200ZPH & 200ZPM

The Vent-Axia Sentinel Kinetic Mechanical Ventilation / Heat Recovery (MVHR) heat recovery unit is designed for the energy efficient ventilation of houses and similar dwellings, conforming to the latest requirements of the Building Regulations document F 2010.

The unit is designed for continuous 24 hour exhaust ventilation of stale moist air from bathrooms, toilets and kitchens. As the stale air is extracted, a heat exchanger within the unit transfers the heat into the supply air entering the bedrooms and lounge.

Sentinel Kinetic  200ZP, 200ZPH & 200ZPM Summer Bypass.

The Sentinel Kinetic is fitted with a Summer Bypass (SBP) and will provide energy-free heating and energy-free cooling when the house temperature and ambient temperature allows.

If the room is warmer than the set (shown as "indoor") temperature (i.e. you need the room to be cooler) and the outdoor air is cooler than the actual room temperature (i.e. the outdoor air could cool your room) then the SBP will open and the unit will supply cooler air to your room.

If the room is cooler than the set ("indoor") temperature (i.e. you need the room heating) and the outdoor air is warmer than the actual room temperature (i.e. the outdoor air could heat your room) then the SBP will open and the unit will supply warmer air to your room.

Note that the above only applies whilst the outdoor air temperature is above 14C (adjustable) in order to prevent cold draughts.

The set ("indoor") temperature should be set 2 or 3 degrees higher than the central heating thermostat and 2 or 3 degrees below any air conditioning thermostat if fitted. This will prevent any clash between these separate systems.

Models

- 407161 - Sentinel Kinetic 200ZP with Summer Bypass and Wired Remote Control.
- 407162 - Sentinel Kinetic 200ZPH with Summer Bypass, Integral humidity sensor & Wired Remote
- 407476 - Sentinel Kinetic 200ZPM with Summer Bypass and Vent-Wise PCB

Accessories

- 441838 - Sentinel Kinetic plug-in integral humidity sensor
- 441780 - Vent-Wise accessory pack (Requires sensors)
- 447340 - Opto Coupler

A range of sensors can be used to manage system demand and control the ventilation rate. These include an internal humidity sensor, humidity sensors for independent mounting in rooms, CO₂ sensor, Vent-Wise sensors, manual switches and pull cords. For these alternative control options, see www.vent-axia.com

**Performance graph 200ZP, 200ZPH & 200ZPM**

![Performance graph 200ZP, 200ZPH & 200ZPM](image-url)
Overview

The following instructions are intended to help prevent potential hazards and installation should only be carried out by a qualified electrician and installer.

Before Installation of the Unit

Inspect the Unit

When taking delivery of the unit, check the items delivered against the enclosed delivery note. Inspect the unit for damage in transit. If in doubt, contact Customer Services. Each box contains a Kinetic unit, anti-vibration mounts and product documentation. In addition the Sentinel Kinetic 200ZP and ZPH models include a remote control and cable.

Lift and Move the Unit Safely

Check the weight of the unit that you are installing. Always use appropriate lifting techniques and appliances when moving heavy equipment.

Check Site Requirements and Safety Notices

Check that the physical and environmental conditions for the site meet, or exceed, the requirements detailed in the Technical Specification.

Unit Installation

The unit MUST always be mounted horizontally. Do not use this unit as a support for any other equipment.

The ceiling should have sufficient strength to support the unit.

Take into consideration the position of the electrical services and the condensate drain.

Ensure there is adequate access for installation, operation and maintenance.

It is recommended that a local disconnection mains and sensor terminal box is installed within 1m of the unit to facilitate future maintenance.
**Ceiling Mounting**

**Step 1:** Mark out and drill four fixing holes in concrete ceiling slab.

**Step 2:** Insert four fixing studs in holes.
For ceilings made of other materials use appropriate fasteners

**Step 3:** Fit anti vibration mounts

**Step 4:** Offer unit up to studs and tighten nuts
Step 5: Duct Layout:
1. Always use a short piece of flexible ducting 100-150mm long, extended to its full length when connecting to ductwork.
2. Securely connect this ducting to the spigots using worm-drive clips or cable ties and duct tape.
3. Insulate any ducting passing through an unheated space to prevent any heat losses and surface condensation.

Stage 6: Connect the 22mm condensate drain outlet to the buildings waste water system.

A water trap must be fitted between the unit and the rest of the waste system.

Please note you must ensure that there is a minimum of a 3 degree downward angle to allow water to drain away from the unit naturally.

Please Note: In areas where freezing weather conditions occur, outlet pipes must be insulated to avoid blockage by ice, which may cause damage to the unit and surroundings.
Electrical Installation

Connect the Wired remote Control

1. The Wired remote Control is supplied with a 15 metre long cable to connect to the unit; it can be permanently mounted in a living space for the end user or used for commissioning the unit.

2. Fit the Remote Control cable plug into the cable socket fitted to the Heat Recovery Unit.

3. Connect the cable assembly to the Remote Control terminal block (the terminal block is colour coded to match the individual coloured cables and mount onto a single gang recessed wall box with the two screws provided. The wired remote Control will automatically be detected.
Accessing Control Terminals

BEFORE COMMENCING ENSURE UNIT IS DISCONNECTED FROM THE MAINS SUPPLY

**Stage 1:** Remove retaining screws from electrical enclosure

**Stage 2:** Slide enclosure to its lower position

**Stage 3:** Remove cover screws and enclosure cover

**Stage 4:** Connect sensor and switch cables to terminals. Use cable clamps and grommets provided
Connect Switches and Sensors

The unit can be switched to boost by a variety of methods:

- Applying 240V to the LS input.
- Switching across 1 of 5 pairs of switch terminals.
- Applying between 0 and 10 V as a proportional input to two input terminals.

In addition, fitting a Vent-Wise Accessory to the unit means that switch terminals 1-3 can be connected to be switched by a current detector (for example, detecting a hob being switched on) or a temperature sensor (for example, detecting the flow of hot water). Terminal 4 can be used in conjunction with a momentary switch or switches.

Connect any switches or sensors required to control the unit by connecting to the terminal connectors at the bottom of the control board as shown below and in Table 1. If necessary contact Vent-Axia regarding the wiring and fixing of accessories and sensors.

### Connect the Power Supply

**WARNINGS**

1. MAINS SUPPLY VOLTAGES (220-240 V AC) ARE PRESENT IN THIS EQUIPMENT, WHICH MAY CAUSE DEATH OR SERIOUS INJURY BY ELECTRIC SHOCK. ONLY A QUALIFIED ELECTRICIAN OR INSTALLER SHOULD CONNECT THE POWER SUPPLY TO THIS UNIT.

2. THIS UNIT MUST BE CORRECTLY EARTHED.

This unit is designed for operation from a single-phase alternating current source (220-240V AC). A 2m cable is connected internally to the unit for connection to an Isolator switch. N.B. The unit must be wired so that all of the conductors can be isolated from the mains supply, with a minimum 3mm gap between the contacts.

To connect the power supply:

1. Ensure the local AC power supply is switched off.

   One end of the power cable supplied is already connected to the unit.

   Connect the other end of the cable to the switched fused spur.

   Use cable clamps and clips to secure the cable, as appropriate.

   If the LS core of the mains cable is not used it should be terminated in an appropriate manner.
Connecting a Boost (Light) Switch

A Switched Live (LS) may be used to boost the airflow when a light is turned on, for instance in a bathroom or kitchen.

NOTE

Power supplied to the unit via a three pole isolating switch, such as Vent-Axia Part Number 563518, must be supplied via the same circuit as the LS connection.

Alternatively an isolator relay controller, part number 442030, may be used. The live supply to the unit should be fused at 3A.

Example wiring diagrams are available via Vent-Axia Technical support, e.g. Drawing Number 448144.
Start Up

Powering Up the Unit

Switching On
To switch the unit on:
1. Switch on the power at the mains supply isolator feeding the unit.
2. Following switch-on, the fan motors will start and the Remote Wired Control will display a series of start-up screens, described below.

N.B. If you are intending to carry out work or maintenance inside the unit, switch off the power at the mains outlet supplying the unit before you remove the covers.

Switching Off
To switch the unit off:
1. Turn the power off at the mains supply isolator.

Wired Remote Control Display

Display
The main display is an LCD, see overview on page 21.

Buttons
Four buttons on the Control Unit provide the controls for configuring and monitoring the unit.

<table>
<thead>
<tr>
<th>Button</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>SET</td>
<td>Press to adjust settings and press to save settings.</td>
</tr>
<tr>
<td>▲</td>
<td>Press to go to the previous screen or to increase a parameter value. Press and hold for more than 2 seconds for fast scrolling.</td>
</tr>
<tr>
<td>✔</td>
<td>Press to go to the next screen or to decrease a parameter value. Press and hold for more than 2 seconds for fast scrolling.</td>
</tr>
<tr>
<td>✤</td>
<td>Press to activate Boost mode. See page 16 for options. Press and hold for 5 seconds to activate Purge mode. (Press and hold for 5 seconds to cancel Purge).</td>
</tr>
</tbody>
</table>
Start-up Screens

**Sentinel Kinetic Version Screen**

The Sentinel Kinetic Version screen displays the firmware version number for 3 seconds.

No adjustments are possible on this screen.

**Language Screen**

The Language screen displays the language used for the screens. It is typically displayed for 5 seconds, or longer if changing the setting.

(To re select a new language disconnect and then reconnect to the mains supply).

**Control Mode Screen**

This allows a choice between the control mode described in this document and an alternative control mode.

**Airflow Units Screen**

The Airflow Units is a percentage of the unit’s maximum flow.

**Wireless Control Screen**

Not available.

**Humidity Sensor Screen**

The Humidity Sensor screen displays whether the humidity sensor is fitted. It is typically displayed for 3 seconds.

**Low Airflow / Normal Airflow / Boost Airflow Screen**

When the start-up screens are finished, the low or normal screen is displayed showing operating status (Low Airflow X % or Normal Airflow X % or Boost Airflow X %).

The Normal screen displays the rate of normal airflow (supply air) through the unit.

If the installation has proportional sensors or an internal humidity sensor fitted, an α symbol will be displayed when humidity sensor is boosting the airflow.

When the summer bypass is active, the normal screen top line will alternate (for 3 seconds) with Summer Bypass On.
An interval can be set, see page 29, at which the unit reminds the user to check the filters. The normal screen top line will include Check Filter as a reminder to check and, if necessary, clean or replace the filters. When this has been done, press and hold the \( \bigwedge \) and \( \bigvee \) buttons for 5 seconds to reset the automatic message.

Pressing the \( \bigcirc \) button activates the boost airflow mode when extra ventilation is required.

<table>
<thead>
<tr>
<th>No. of presses</th>
<th>Boost action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Boosts for 30 minutes</td>
</tr>
<tr>
<td>2</td>
<td>Boosts for 60 minutes</td>
</tr>
<tr>
<td>3</td>
<td>Boosts continuously</td>
</tr>
<tr>
<td>4</td>
<td>Back to Normal flow rate</td>
</tr>
</tbody>
</table>

If the wireless boost option is fitted, this can be triggered from the wireless transmitter/boost switch.

If the installation has switch sensors, is wired to the lighting, has Vent-Wise sensors, Vent-Wise momentary switch or if the internal time switch is set for periodic operation, operation will change from normal to boost automatically. Pressing the \( \bigcirc \) button will reveal a code to show which device has activated boost.

\[ \begin{align*}
s1 &= \text{Switch S/W1} \\
 s2 &= \text{Switch S/W2} \\
 s3 &= \text{Switch S/W3} \\
 s4 &= \text{Switch SW4} \\
 s5 &= \text{Switch SW5} \\
 v1 &= \text{Vent-Wise Input S/W1} \\
 v2 &= \text{Vent-Wise Input S/W2} \\
 v3 &= \text{Vent-Wise Input S/W3} \\
 ls &= \text{Switched live (LS)} \\
 c1-3 &= \text{Internal Time switch}
\end{align*} \]

If running on boost due to pressing the \( \bigcirc \) button, another device may ‘take over’ the boost. Flow will return to normal when that device switches off. If a number of different devices are calling for boost flow, the unit will run at boost until the last one has reverted to normal.
**Purge Screen**

Pressing and holding the button for approximately 5 seconds activates purge mode when you want to purge air from the building. The unit will revert to normal flow by pressing and holding the button again for 5 seconds. If the wireless boost option is fitted, purge can be triggered from the wireless transmitter/boost switch.

Purge mode runs the fans at full speed for 2 hours (120 minutes). The Purge screen displays a countdown of the time remaining.

**Low Airflow Screen**

Low Airflow mode is activated when the Normal Airflow is set to Off.

The Normal Airflow mode can be set to run during the daytime i.e. from 6am to 11pm, the Low Airflow mode will then run during the night from 11pm to 6pm.

**Set Clock Screen**

From the Normal Airflow screen, simply press the button once to access the Set Clock screen.

The Set Clock Control screen enables you to change the clock settings. The clock retains its settings for approximately two weeks without mains power, after which it will need resetting when power is reconnected. Values are DDD HH:MM.

Return to the normal display by pressing the button or leave to timeout and return automatically after 2 minutes.

The unit will not automatically switch for daylight saving time.

**Summer Mode Screen**

From the Normal Airflow screen, simply press the button twice to access the Summer Mode screen.

If the unit is a summer bypass model, the Summer Mode screen enables you to switch the summer bypass control on or off. This screen is only displayed when the bypass is fitted.

Options available are On (default) and Off.

Return to the normal display by pressing the button or leave to timeout and return automatically after 2 minutes.
Indoor Temp Screen

From the Normal Airflow screen, simply press the button until the Indoor Temp screen is displayed.

The Indoor Temp screen enables you to choose the target room temperature in degrees Centigrade – only displayed when the bypass is fitted.

Selectable range is 16-40 (25 default).

Return to the normal display by pressing the button or leave to timeout and return automatically after 2 minutes.

This function will only work when the Summer Mode is set to on.

Outdoor Temp Screen

From the Normal Airflow screen, simply press the button until the Indoor Temp is displayed. Press button to choose the required temperature and then press button again to confirm the entry and this will call up Outdoor Temp.

The Outdoor Temp screen enables you to choose the minimum outdoor temperature at which the bypass will operate in degrees Centigrade – only displayed when the bypass is fitted.

Use this to prevent cold draughts being introduced.

Selectable range is 5C – 20C (14C default).

Return to the normal display by pressing the button or leave to timeout and return automatically after 2 minutes.

This function will only work when the Summer Mode is set to on.
**Overview**

The instructions in this section are intended to provide configuration and operation information for setting up the equipment. In the event of problems, see *Troubleshooting* on page 35.

Follow good practice when commissioning the unit. Ensure that the system is installed according to the system designer's intent incorporating any acoustic ducting, that all joints are airtight, ducting is well supported, bends are avoided close to vents, and that the vent valves are fully open at the start of the commissioning process.

The following is attached to the unit and should be used as a checklist prior to setting the airflows.

---

**MVHR Installation Checklist**

REQUIRED TO BE COMPLETE TO COMPLY WITH CONDITIONS OF WARRANTY, but does not affect statutory rights.

This is a short check list of good practice do’s and don’ts that may affect the safety or functionality of the installation. It is not a complete list of what is required. They must be complied with in order to ensure that the installation performs as expected.

Wired remote Control Screens Summary
Commissioning Screens

The commissioning screens enable you to configure the operational settings of the unit. Settings are stored in non-volatile memory and will be retained irrespective of mains supply breaks.

Note: Access to the commissioning screens is prevented if the display shows Antifrost Active, Heating Failure or a Fault Code. In this event, switch the unit off and on again and enter the commissioning screens within one minute. If you are within the commissioning screens the Antifrost and Heating Failures modes will not operate allowing the flow rates to be adjusted even in a property that is below 5°C.

To access the commissioning screens: Press and hold the ▲, ▼ and SET buttons for 5 seconds.

Start with SET followed by UP then Down arrows.

To return to the normal screen, either press and hold the ▲ button to reach the first menu item and then hold for a further 5 seconds. Alternatively, the normal display will resume if no buttons are pressed for two minutes.

Security PIN Screen

If a security PIN code has been previously set, this screen will display ****.

Enter the PIN using ▲, ▼ and SET buttons.

Note 1

Whilst displaying the Low, Normal, Boost Supply, Low, Normal, Boost Extract screens the fans will run at the displayed % flow and the bypass will remain shut. The two-minute automatic return to normal display time is extended to four hours to allow time for measurements or adjustments.

Boost Supply Screen

The Boost Supply screen enables you to set the Boost airflow speed for the Supply fan in order to balance out any differences in ductwork or other installation features.

Default Boost speed = 50%.

The Boost speed cannot be set above the Cooker Hood speed (see page 23) or below Normal speed setting.

Boost Extract Screen

The Boost Extract screen enables you to set the Extract airflow speed for the Extract fan in order to balance out any differences in ductwork or other installation features.

Default Boost speed = 50%.

The Boost speed cannot be set above the Cooker Hood speed (see page 23) or below Normal speed setting.
**Normal Supply Screen**

The Normal Supply screen enables you to set the Normal airflow speed for the Supply fan in order to balance out any differences in ductwork or other installation features.

Default Normal speed = 30%

The Normal speed cannot be set below Low speed or above Boost speed setting.

**Normal Extract Screen**

The Normal Extract screen enables you to set the Normal airflow speed for the Extract fan in order to balance out any differences in ductwork or other installation features.

Default Normal speed = 30%

The Normal speed cannot be set below Low speed or above Boost speed setting.

**Low Supply Screen**

The Low Supply screen enables you to set the Low airflow speed for the Supply fan in order to balance out any differences in ductwork or other installation features.

Default Low speed = 20%

The Low speed cannot be set below 1% or above Normal speed setting.

**Low Extract Screen**

The Low Extract screen enables you to set the Low airflow speed for the Extract fan in order to balance out any differences in ductwork or other installation features.

Default Low speed = 20%

The Low speed cannot be set below 1% or above Normal speed setting.

**Cooker Hood Supply & Extract Screens**

The Cooker Hood Supply & Extract screens are non-functional.
**Boost Overrun Screen**

The Boost Overrun screen enables you to set a time period for the fans to boost airflow (in minutes) after the light switch (LS input) is turned off. It will then return to normal airflow.

Selectable range: minimum = 00, maximum = 25, default = 15.

Boost Overrun screen does not function for inputs S/W1 to S/W3 and SW4, SW5.

**Boost Delay Screen**

The Boost Delay screen enables you to set the time delay (in minutes) from the light switch (LS input) being switched on to the airflow boost being activated. This is used to prevent the unit from boosting unnecessarily when the light switch is switched on for short periods.

Selectable range: min. = 00, max. = 10, default = 00.

**Boost On/Off Screen**

The Boost On/Off screen enables you to set a time for boost to be activated for each day of the week.

You can set up to three On/Off times per day, shown as Day1, Day2 and Day3. If On and Off times are the same, the unit will not change speed.

On time cannot be set earlier than a previous off time, Likewise, Off time cannot be set earlier than a previous On time.

To set a weekly schedule:
Setting starts at Mon1 and uses (→) to show, by flashing, which item is available for adjustment with the (A) and (V) buttons (a → b → c → d → e → Mon2 and so on).

Mon1 10:01 11:11

↑ ↑ ↑ ↑

a b c d e

When Day flashes, pressing (> 2 sec) will copy yesterday’s times to today.

Setting finishes when the last off minutes for Sun3 are accepted, at which point the screen will now show All Set or holding the button for 3 seconds.
Normal On/Off Screen

The Normal Airflow mode can be set to run during the daytime i.e. from 6am to 11pm, the Low Airflow mode will then run during the night from 11pm to 6pm.

The Normal On/Off screen enables you to set a time for Normal to be activated for each day of the week.

You can set up to one On/Off time per day, if On and Off times are the same, the unit will not change speed.

On time cannot be set earlier than a previous off time, Likewise, Off time cannot be set earlier than a previous On time.

To set a weekly schedule:
Setting starts at Mon and uses \( \text{SET} \) to show, by flashing, which item is available for adjustment with the \( \land \) and \( \lor \) buttons (a \( \rightarrow \) b \( \rightarrow \) c \( \rightarrow \) d \( \rightarrow \) e \( \rightarrow \) Mon and so on).

Mon 10:01 11:11
\[ \uparrow \quad \uparrow \quad \uparrow \quad \uparrow \quad \uparrow \]
\[ a \quad b \quad c \quad d \quad e \]

When Day flashes, pressing \( \text{SET} \) (> 2 sec) will copy yesterday’s times to today.

Setting finishes when the last off minutes for Sun are accepted, at which point the screen will now show All Set or holding the \( \text{SET} \) button for 3 seconds.

Set Service No Screen

The Set Service No screen enables you to enter the telephone number that should be called for service in the event the unit fault.

Initially the screen is blank. Press \( \text{SET} \) to get a 0. Use \( \land \) and \( \lor \) buttons to change between 0 and 9 (or blank). Repeat until the number is entered. Finally, select a blank and press \( \text{SET} \) to finish. Maximum 16 digits.

Press and hold \( \text{SET} \) for more than 2 seconds to clear service number.

Internal Humidity Sensor Screen (if fitted)

The Humidity Sensor screen enables you to switch the Sensor On and adjust the trigger point between 60% and 70 %. (default setting 70%).
Proportional 1 Screen

The Proportional 1 screen enables the conditions of the proportional sensors to be set.

The unit can receive a 0-10 V proportional signal from either a humidity, CO2 or temperature external sensor, when connected to terminals P1.

By default, the Proportion 1 input is set for a humidity sensor operation.

When you have selected the sensor type, screens for the appropriate boost and normal limits are displayed.

Press (Enter) and use the (▲) and (▼) buttons to change the selection (Humidity-default, CO2, Temperature).

When the input signal is below the ‘Normal Limit’, the unit runs at low / normal airflow. When the signal is above the ‘Boost Limit’, the unit runs at boost airflow. Between these limits the unit runs at a proportional airflow.

For a humidity sensor, a percentage value must be entered for boost and normal settings. For range and default values, see Table 2 below.

For a CO2 sensor, a figure (in ppm) must be entered for boost and normal settings. For range and default values, see Table 2 below.

For a Temperature sensor, a figure (in degrees C) must be entered for boost and normal settings. For range and default values, see Table 2 below.

Table 2: Boost & Normal Limits – Defaults and Adjustment Range

<table>
<thead>
<tr>
<th>Sensor</th>
<th>Humidity</th>
<th>CO2</th>
<th>Temperature</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Default (%)</td>
<td>Range (%)</td>
<td>Default (ppm)</td>
</tr>
<tr>
<td>Normal limit</td>
<td>60</td>
<td>25-90</td>
<td>1000</td>
</tr>
</tbody>
</table>
Proportional 2 Screen

By default, the Proportional 2 input is set to CO₂ sensor operation.

See Proportion 1 Screen for a description.

SW4 Screen

Momentary closure (1 sec) starts or stops boost for set time.

Selectable range: min. = 15, max. = 30.

Default = Off when no Vent-Wise card fitted.

Vent-Wise Screens

These screens are only displayed if a Vent-Wise Card is fitted. Replacing J6 3-4 link with a Vent-Wise board converts S/W1, S/W2 and S/W3 from switch inputs to Vent-Wise inputs. In addition SW4 can be used by a momentary switch.

Vent-Wise sensors measure current or temperature. When the current or temperature exceeds a ‘trip’ level, boost airflow is selected. Low / Normal airflow is resumed after a timed delay once the current or temperature has dropped below the trip level.

Any of the sensor types can be connected to S/W1, S/W2 or S/W3 but once the Vent-Wise Card is fitted, ordinary switches must not be used.

In use, the Vent-Wise Card with three sensors will run hot to the touch albeit well below its maximum temperature. If any input is shorted (e.g. used with switch), the board will overheat and shut down.

Nominal trip level is with the Load Pot set to (60 %). A temperature sensor will trip with hot water at around 40°C and a current one around 1.5 A. Time Pot setting is from 1 to 25 minutes with a default of 20 minutes.

A one-second push on a momentary switch wired to SW4 will run boost for up to 25 minutes. The overrun timer can be set from 15 to 30 minutes. A second one-second push will cancel the boost as would a “cancel boost” signal from one of the sensors. Multiple momentary switches may be wired in parallel to SW4.

Screens for each of the three switches are displayed. Enter a percentage value for the Load Pot setting.

* Shows Vent-Wise signal and indicates the unit is running in Boost mode

Selectable range: min. = 5, max. = 95, default = 60.

Enter a time (in minutes) for the Time Pot setting.

Selectable range: min. = 1, max. = 25, default = 20.

Momentary closure (1 sec) starts or stops boost for set time.

Selectable range: min. = 15, max. = 30.

Default = 25 when Vent-Wise card fitted
Summer Bypass Screen
The Summer Bypass screen is factory set if one has been fitted. It will only need resetting if a replacement control board has been fitted.
Available options = Not fitted (default) and Fitted.

Antifrost Screen
The Antifrost screen is only displayed if a summer bypass is fitted. In installations where a negative pressure is not permitted during antifrost operation, set this to bypass mode.
Available options: Airflow Mode (default) and Bypass Mode.

Airflow Mode - When the supply air temperature is between 0° and -20°C, antifrost will automatically activate. This will reduce the supply airflow rate and increase the extract airflow rate to prevent frost forming on the heat exchanger. During antifrost operation the supply motor can stop for 15 minutes hour and run for 45, depending on the temperature below 0°C. If the supply air temperature is -20°C or below the supply fan switches off and the extract fan continues to run at reduced rate to prevent frost forming on the heat exchanger.

Bypass Mode - While the supply air temperature is below 0°C, the antifrost mode will automatically activate. This mode will open the bypass to prevent frost forming on the heat exchanger.

Dryout Screen
The Dryout screen enables the fans to be run at max speed for a week before returning to normal operation. This feature can help to dry out fresh plaster and paint enabling building work to be completed more quickly.
Filters may become fouled during this time and should be cleaned or replaced afterwards.
Available options: Off (default) and On.

Running Time Screen
The Running Time screen displays the total running time of the unit (in hours).
No changes may be made to this screen. In the event of power failure total time will be retained.
Filter Life

Press and then use the and push-buttons to select the time between Filter Services. The options are Urban (6 months), Suburban (default: 12 months) or Rural (18 months).

BMS screen

On for BMS (default) or Off for Wired Remote Control, automatically set up by BMS signal or Wired Remote Control when either is plugged into BMS RJ11 socket.

The BMS screen displays byte count and first 16 bytes from the Building Management System (BMS) system. The output may controlled by a BMS system to switch the unit on or off for example in conjunction with a smoke alarm.

No changes may be made to this screen.

Security PIN Screen

The Security PIN screen enables you to set a four-digit personal identification number (PIN) to access the commissioning screens. This screen will show blank if security is disabled and no PIN is used.

Press to reveal 0000 with the first 0 flashing and use the and buttons to change the selection (0-9). Press again to accept the digit and move to the next. Repeat until all four digits are specified.

Press and hold for more than 2 seconds to clear security PIN.

Restore Defaults Screen

The Restore Defaults screen enables you to restore the default settings for all screens.

Available options: No (default) and Yes.

The default commissioning settings are present when the unit is switched on and can be restored by setting the Restore Defaults screen to Yes.

</tbody>
</table>
Heat recovery units, by their very nature, require regular maintenance. The Sentinel Kinetic 200ZP, 200ZPH and 200ZPM have been designed to facilitate access to enable maintenance to be carried out easily.

**WARNING**

THE FAN AND ANCILLARY CONTROL EQUIPMENT MUST BE ISOLATED FROM THE POWER SUPPLY DURING MAINTENANCE.

### Filter Maintenance

<table>
<thead>
<tr>
<th>Item</th>
<th>Action</th>
</tr>
</thead>
</table>
| **Fan Filters**    | When the unit displays “Check filters”. This is a reminder to ensure that the filters are not so dirty that they are blocking the airflow or allowing dirt to pass through. The rate at which the filters become dirty will vary depending on the environment and the activity within the property.  
1. Remove 2 filter covers and filters.  
2. Clean gently by tapping or carefully using a vacuum cleaner if necessary.  
3. Replace the filters and cover plates  
4. Reset the automatic message, press and hold the ″ and ″ buttons for 5 seconds. |

### 12 Monthly Maintenance

<table>
<thead>
<tr>
<th>Item</th>
<th>Action</th>
</tr>
</thead>
</table>
| **Fan Filters** (Interval to suit environment) | Change the Fan Filters depending on which environment the unit has been installed: urban: suburban or rural.  
1. Remove 2 filter covers and filters.  
2. Insert the replacement filters.  
3. Replace the filters and covers.  
4. Reset the automatic message, press and hold the ″ and ″ buttons for 5 seconds. |
| **Unit & Heat Exchanger Cell**         | Inspecting and cleaning the unit: See the following pages                                                                 |
| **Motors**                             | Inspect the motors for build-up of dust and dirt on the impeller blades, which could cause imbalance and increased noise levels. Vacuum or clean if necessary. |
| **Condensate Drain**                   | Check the condensate drain tube is secure and clear of debris. Clean if necessary.                                                    |
| **Fastenings**                         | Check that all unit and wall-mount fastenings are sufficiently tight and have not become loose. Re-tighten if necessary.                |
Filter Maintenance

Prise Filter Covers loose using finger slots.

Remove Filter Covers.

Filters can now be pulled out using the attached Ribbons.

Clean Filters gently by tapping or carefully using a vacuum cleaner if necessary. Filters can now be pushed back into their slots and the covers replaced.
Heat Exchanger Maintenance

Warning disconnect from mains supply before proceeding.

Remove condensate drainpipe.

Caution: some water may pour from the drain and pipe during this operation.

Remove the six case sleeve nuts and the two washers and retain for reassembly.

Gently ease the case apart by pulling downwards on the handholds.

The Heat Recovery Cell will come away with the lower case.

Caution: there may be water in the lower case and Heat recovery cell that may spill during this operation.
Lift Heat Exchanger from Lower Case

Wash the inside of the Lower case and Heat Exchanger in warm water using Milton Fluid or equivalent and dry thoroughly.

Replace Heat Exchanger in Lower Case ensuring that it is orientated correctly, following directions on label. The label should be visible and the arrow should point towards the fan end of the unit. Failure to do this will affect the unit’s performance.

Re attach the lower case to the unit and fasten the screws.

**Spares**

The following spares can be ordered from Vent-Axia:

<table>

Troubleshooting

Diagnosing a Problem

In the event of a problem, always troubleshoot the unit according to:

- **Fault code** displayed on the Control Unit.
- **Fault LED** if connected.

If no indications are displayed, then troubleshoot problem according to the fault symptom as described in the following tables.

**Service/Fault Code Screens**

The Service screen is displayed, alternating with the Fault Code screen, when a fault has caused the unit to switch off and you must phone the telephone number displayed on the screen for assistance.

The Fault Code screen is displayed, alternating with the Service screen, when a fault has occurred. Take note of the fault code when reporting a fault.

For assistance contact the service provider and quote the fault code number. The following fault codes numbers may be displayed.

**Code numbers are added together if more than one is detected.**

**Table 4: Fault Codes**

<table>
<thead>
<tr>
<th>Code</th>

<td>Temperature sensor T2 (extract) faulty</td>
</tr>
<tr>
<td>32</td>
<td>Wired Remote Control failure</td>
</tr>
</tbody>
</table>

**Room Too Cold screen**

The Room Too Cold screen displays the status of the fan. If the heating system in the building fails and the internal temperature drops below 5°C, the unit will stop running so prevent cold air entering an already cold house. The unit will start up every hour and will run for a short time to measure the temperature of the property. When the temperature rises, e.g., the heating system is switched back on, the unit will restart and continue normal operation.

Bottom line of display may be (Fan Off, Fan Restarting)

**Note:** access to the commissioning screens is prevented if the display shows **Antifrost Active**, **Room Too Cold** or a **Fault Code**. In this event, switch the unit off and on again and enter the commissioning screens within one minute. If you are within the commissioning screens the Antifrost and Room Too Cold Failures modes will not operate allowing the flow rates to be adjusted even in a property which is below 5°C.
Appendix: Options and Accessories

**CO₂ Sensor**

An optional wall-mounted CO₂ Sensor (433257) may be used to control airflow. The CO₂ sensor measures the CO₂ level in ppm (parts per million) and the unit adjusts the fan speed accordingly. When the CO₂ level is below the lower threshold (adjustable), the fan will run at Normal speed. When the CO₂ level is above the upper threshold (also adjustable), the fan will run at Boost speed. If the CO₂ level is between the lower and upper thresholds, the fan will run at a speed between Normal and Boost proportional to the difference between the CO₂ level and the thresholds.

**Normal / Boost Switch**

An optional Normal/Boost Switch (455213) may be used to control airflow. Connecting a switch will enable a manual control to be used in conjunction with other boost controls.

**Humidistats**

An internal Relative Humidity Sensor PCB (441838) may be used to control airflow. The unit adjusts the fan speed proportionally depending on the temperature and relative humidity levels in the extracted air whilst avoiding nuisance tripping at night time when temperatures drop and relative humidity naturally rises. The unit does not just look for relative humidity levels above a set point, which can be unreliable in products that extract from multiple rooms, but it also looks for rapid increase in relative humidity typically generated by such activities as showering or cooking.

**Connecting an opto-coupler (447340)**

The LED terminals are intended to drive a remote LED to indicate that a fault has occurred. They provide a 5 V LED driving signal output between the + and – terminals that enables remote indication of a unit fault. See the Control Panel for fault code (Refer to installation and commissioning guide listed above). This signal could also be used by a BMS system so that it is informed that a fault has occurred. If a volt-free contact is required then use this opto-coupler to provide electrical separation.

Connect the flying leads of the opto-coupler pcb into the LED terminals, + to + and - to -
Connect the pair of leads from the BMS to the terminal block of the opto-coupler pcb. Polarity does not matter here.

The **Vent-Axia** Guarantee

Applicable only to products installed and used in the United Kingdom. For details of guarantee outside the United Kingdom, contact your local supplier.

Vent-Axia guarantees its products for two years from date of purchase against faulty material or workmanship. In the event of any part being found to be defective, the product will be repaired, or at the Company’s option replaced, without charge, provided that the product:

- Has been installed and used in accordance with the instructions given with each unit.
- Has not been connected to an unsuitable electricity supply. (The correct electricity supply voltage is shown on the product rating label attached to the unit).
- Has not been subjected to misuse, neglect or damage.
- Has not been modified or repaired by any person not authorised by the company.

Vent-Axia Lo-Carbon products offer an extended guarantee on the motor to 5 years.

**IF CLAIMING UNDER TERMS OF GUARANTEE**

Please return the complete product, carriage paid to your original supplier or nearest Vent-Axia Centre, by post or personal visit. Please ensure that it is adequately packed and accompanied by a letter clearly marked “Guarantee Claim” stating the nature of the fault and providing evidence of date and source of purchase.

The guarantee is offered to you as an extra benefit, and does not affect your legal rights.
